Paracetamol overdose presenting 8-24hrs

(Ingested total overdose in ≤1 hour time period)

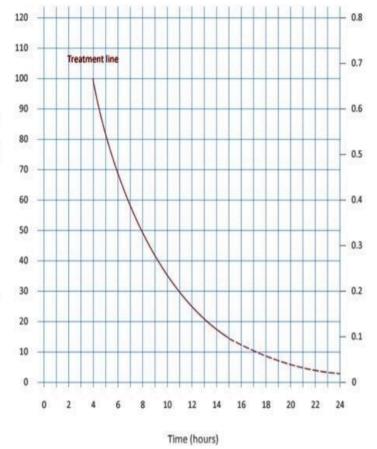

before the end of infusion 3 and 4.

Plasma-paracetamol

concentration

(mmol/litre)

Paracetamol treatment nomogram and 12-hr shortened N-acetylcysteine dosing schedule (SNAP protocol)

Reproduced courtesy of MHRA

If unclear which of the five paracetamol overdose protocols to follow, discuss with ED / paeds Reg / Cons.

Greater Glasgow and Clyde

In situations where paracetamol levels will be used to determine need for acetylcysteine (refer to appropriate protocol), plot the measured plasma concentration (in mg/L) against the time since ingestion. If plasma level falls above the line then give acetylcysteine as detailed below.

The nomogram is less accurate between 15-24 hours and accurate ingestion time is even more vital.

Actual weight should be used for calculating both the toxic dose and the acetylcysteine dose - up to a **maximum of 110 kg**

Reactions to acetylcysteine include flushing, nausea & vomiting.

Please use 'Acetylcysteine Antidote Adverse Effects – Features & Management' guidance to document any adverse events and guide further management.

Hypersensitivity and anaphylactoid reactions with acetylcysteine are not contraindications as the benefit of treatment still outweighs the risk of not treating.

True anaphylaxis is rare with acetylcysteine but can be managed by stopping the infusion and then restarting at a slower rate.

Table 1. 12-hr shortened N-acetylcysteine dosing schedule (SNAP protocol).

Regimen	First infusion Second (& extended) infusion					
Infusion fluid	200mL sodium chloride (0.9% or 5% glucose	1000mL sodium chloride 0.9% or 5% glucose			
Preparation	Use 250mL infusion bag and add required volur		Add required volume of acetylcysteine to 1000mL infusion bag			
Duration of infusion	2 hc	ours	10 hours			
Drug dose	100mg/kg ace	etylcysteine	200mg/kg acetylcysteine			
Weight (kg)	Ampoule volume (mL)	Infusion rate (mL/h)	Ampoule volume (mL)	Infusion rate (mL/h)		
30-39	18	109	35	104		
40-49	23	112	45	105		
50-59	28	114	55	106		
60-69	33	117	65	107		
70-79	38	119	75	108		
80-89	43	122	85	109		
90-99	48	124	95	110		
100-109	53	127	105	111		
≥ 110	55	128	110	111		

Each ampoule = 200mg/mL acetylcysteine. Dose calculation based on weight in middle of band. Ampoule rounded up to nearest whole number.

Extended treatment	If extended treatment with acetylcysteine is required (see clinical guideline), continue at the dose and infusion rate used for the second infusion and prescribe.				
	Recheck U&Es, bicarbonate, LFTs, FBC and INR 2 hours before the end of infusions 3 and 4 to assess the need to continue. Refer to appropriate protocol regarding discontinuation of extended treatment

Acetylcysteine Antidote Adverse Effects – Features & Management

REACTION to acetylcysteine		COMPLICATIONS of paracetamol ingestion						
None Wheeze		Abnormal liver function						
Flushing Hypoten		Acute kidney injury	Haemorrhage					
		Hypoglycaemia Acidosis	_ Other:					
Date and time of reaction	Initial	Date and time of reaction Initial						
MANAGEMENT OF SIDE EFFECTS								
 N-acetylcysteine may cause anaphylactoid reactions in 2% of cases with this protocol. Flushing, pruritus, rash, hypotension, angioedema, bronchospasm and vomiting are most common. Reactions can be managed by stopping the infusion. Consider chlorphenamine for flushing/itch, nebulised salbutamol if there is bronchospasm and ondansetron if there are GI side effects. Restart the infusion once the reaction has resolved at half the rate to completion of infusion. Previous reaction is NOT a contra-indication to N-acetylcysteine and cases should receive treatment if indicated. Reactions are now considerably less common with the 12-hour SNAP protocol compared to standard regimes. 								
Ondansetron oral or IV slow (over 2m			ns-16 years
