## Therapeutic excess paracetamol overdose

#### (Ingested total overdose in >1 hour time period with no self harm intent)

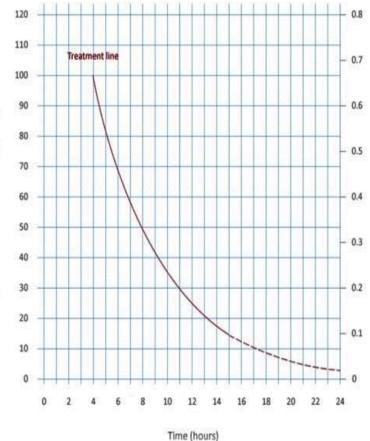

# Paracetamol treatment nomogram and 12-hr shortened N-acetylcysteine dosing schedule (SNAP protocol)

Plasma-paracetamol

concentration (mmol/litre)

Reproduced courtesy of MHRA

# If unclear which of the five paracetamol overdose protocols to follow, discuss with ED / paeds Reg / Cons.

In situations where paracetamol levels will be used to determine need for acetylcysteine (refer to appropriate protocol), plot the measured plasma concentration (in mg/L) against the time since ingestion. If plasma level falls above the line then give acetylcysteine as detailed below.

The nomogram is less accurate between 15-24 hours and accurate ingestion time is even more vital.

Actual weight should be used for calculating both the toxic dose and the acetylcysteine dose - up to a **maximum of 110 kg** 

Reactions to acetylcysteine include flushing, nausea & vomiting.

Please use 'Acetylcysteine Antidote Adverse Effects – Features & Management' guidance to document any adverse events and guide further management.

Hypersensitivity and anaphylactoid reactions with acetylcysteine are not contraindications as the benefit of treatment still outweighs the risk of not treating.

True anaphylaxis is rare with acetylcysteine but can be managed by stopping the infusion and then restarting at a slower rate.

## Table 1. 12-hr shortened N-acetylcysteine dosing schedule (SNAP protocol).

Regimen	First inf	usion	Second (& extended) infusion			
Infusion fluid	200mL sodium chloride (	0.9% or 5% glucose	1000mL sodium chloride 0.9% or 5% glucose			
Preparation	Use 250mL infusion bag and add required volur		Add required volume of acetylcysteine to 1000mL infusion bag			
Duration of infusion	2 hc	ours	10 hours			
Drug dose	100mg/kg ace	etylcysteine	200mg/kg ace	etylcysteine		
Weight (kg)	Ampoule volume (mL)	Infusion rate (mL/h)	Ampoule volume (mL)	Infusion rate (mL/h)		
30-39	18	109	35	104		
40-49	23	112	45	105		
50-59	28 114		55	106		
60-69	33	117	65	107		
70-79	38	119	75	108		
80-89	43	122	85	109		
90-99	48	124	95	110		
100-109	53	127	105	111		
≥ 110	55	128	110	111		

Each ampoule = 200mg/mL acetylcysteine. Dose calculation based on weight in middle of band. Ampoule rounded up to nearest whole number.

### Patients with an increase in INR and normal ALT

Both paracetamol and acetylcysteine treatment may cause an increase in INR in the absence of liver injury. Patients who do not meet any of the criteria for continuation of acetylcysteine treatment but have an increase in INR of 0.4 or less (e.g. 1.1 to 1.5) AND have a normal ALT do not require further acetylcysteine.

Patients who have an increase in INR of 0.5 or more (e.g. 1.1 to 1.6) <u>without</u> an ALT rise - **STOP** acetylcysteine & recheck INR and ALT **after 4 - 6 hours**. If bloods show INR is unchanged or falling <u>AND</u> ALT is less than two times the upper limit of normal then no further treatment is required.

If the criteria above are not met - restart acetylcysteine at the dose and infusion rate used in the last treatment bag.
